| Title | Synthetic Mobility Data |
| Creator / Responsible Partner | TID, IBM |
| Dataset Identifier | 02_SyntheticMobilityDataTID_I-BiDaaS_WP2_D2.1_v0.1.csv.gz |
| DOI | 10.5281/zenodo.4274458 ¹ |
| Dataset Description | This is a synthetic data stream based on real-time, cell network events. These events are picked up by the antennas that are closer to the mobile phone thus providing an approximate location of the device. Every transaction of a mobile phone generates one of those events. A transaction can be, for instance, placing or receiving a call, sending or receiving an SMS, asking for a specific URL in your mobile phone browser, or sending a text message or a data transaction from/to any mobile phone app. There are also some synchronization events like, for instance, turning your mobile phone on or off, or when switching between location area networks (relatively big geographical areas comprising several cell towers). |
| Work Package/Deliverable | WP2/D2.1 |
| Source | TID and IBM determined the rule set for the data fabrication using IBM's TDF. Through an iterative analysis, the rules were improved in order to obtain the fabricated dataset used for testing the MVP. |
| Processing | All the fields containing sensitive information were encrypted using the following encryption formats: <ul style="list-style-type: none"> Format preserving encryption for categorical fields. Order preserving encryption for numerical fields. |
| Repository | Zenodo |
| Language | English |
| Code list | Each network event consists of 8 fields, which are described in detail below: <ul style="list-style-type: none"> Date: An 8-digit date with the following format: YYYYMMDD. EventID: A categorical variable with seven possible values: <ul style="list-style-type: none"> rau: 2% l_service_request: 64% l_tau: 11% l_detach: 5% l_handover: 14% l_attach: 3% l_dedicated_bearer_deactivate: 1% EventResult: A binary categorical variable (and their distribution): <ul style="list-style-type: none"> Success: 96% |
